THIS IS A WORK IN PROGRESS

Source code: github.com/thanasisn/ROUT_analysis

Abstract

This document provides a statistical estimation of checkpoint passage times based on a given total race time. These calculations are intended to help runners plan their race strategy. Additionally, we include information about sun and moon positions to assist with overall race planning and strategy, and weather data obtained from open-meteo.com.

Data

All performance data were obtained directly from the race website (www.rout.gr). The location of each checkpoint along the race route was derived from the race GPX track and associated maps.

Classes of performance models from the 2024 race results

Based on the distribution of total finishing times, we assume there are r `bbrakes` distinct classes of athletes. To construct a corresponding number of models, finishing times were partitioned into equal-sized bins. At this stage, no additional athlete characteristics (such as age, gender, or experience) are considered. For any given total time, the class corresponding to its bin is used.

Figure 1: Distribution of finishing time in minutes for the 5 classes

For each class and for each segment between consecutive checkpoints, we calculated the corresponding mean pace (minutes per kilometer) and mean speed (kilometers per hour), along with other statistical measures. For each class, these values will be scaled to obtain the corresponding passes from each CP. We also computed the average pace and speed from the start of the race to each checkpoint. The actual source code is displayed below.

```

          median = ~median(.x, na.rm = TRUE),
          min = ~min(.x, na.rm = TRUE),
          max = ~max(.x, na.rm = TRUE),
          sd = ~sd(.x, na.rm = TRUE),

  TT[, AvgSpeed := round(km/(Ttime/60), 2)]

}

```

The detailed model parameters are shown in Table 1. A comparison of the classes can be seen in the Figure 2 based on elapsed time, and on Figure 3 based on covered distance.

Evaluate models against 2025 results.

For all finishers estimate pass times from each CP, using the appropriate class model. Prediction are based on individual finishing time.

We excluded finishing time from the statistical evaluation, as the modelled finishing time is equal.
