A simple data driven prediction of check point passes for Rodopy Ultra Trail (ROUT), based on the finishing times of 2025 ROUT

Abstract

This document provides a statistical estimation of checkpoint passage times based on a given total race time. These calculations are intended to help runners plan their race strategy. Additionally, we include information about sun and moon positions to assist with overall race planning and strategy, and weather data obtained from `open-meteo.com`.

Data

All performance data were obtained directly from the race website (www.rout.gr). The location of each checkpoint along the race route was derived from the race GPX track and associated maps. The astronomical data were computed with `astropy` and `ephem` Python modules, and the meteorological data were obtained through `open-meteo.com` API for each check point, at the time of this document creation.

Classes of performance models from the 2025 race results

Based on the distribution of total finishing times, we assume there are 5 distinct classes of athletes. To construct a corresponding number of models, finishing times were partitioned into equal-sized bins. At this stage, no additional athlete characteristics (such as age, gender, or experience) are considered. For any given total time, the class corresponding to its bin is used.

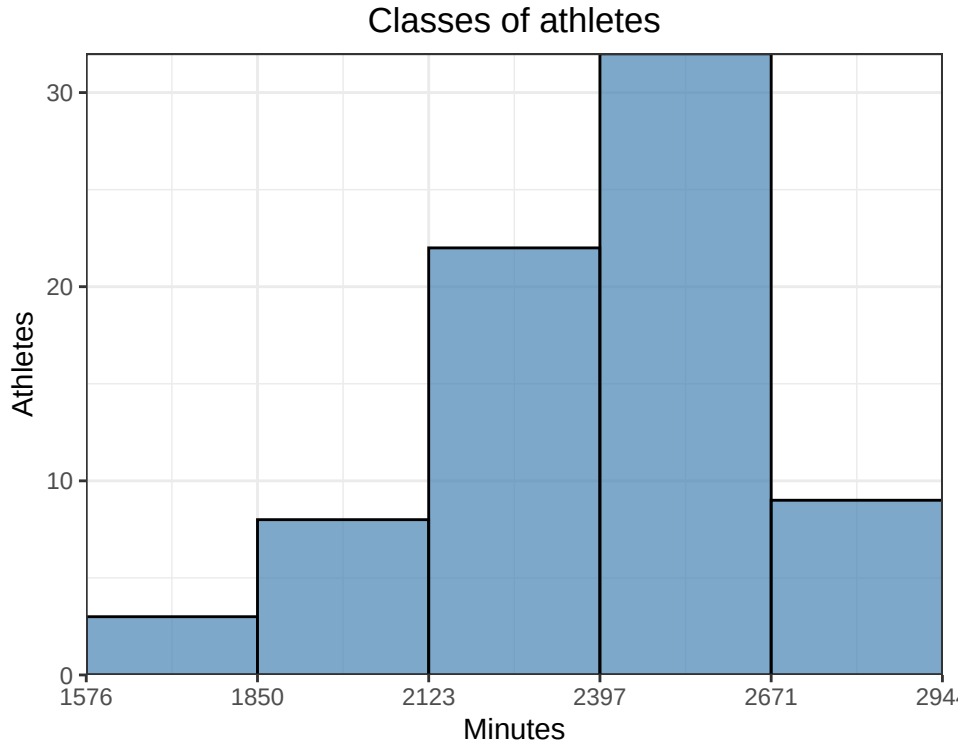

Figure 1: Distribution of finishing time in minutes for the 5 classes

For each class and for each segment between consecutive checkpoints, we calculated the corresponding mean pace (minutes per kilometer) and mean speed (kilometers per hour), along with other statical measures. For each class, these values will be scaled to obtain the corresponding passes from each CP. We also computed the average pace and speed from the start of the race to each checkpoint. The actual source code is displayed below.

The detailed model parameters are shown in Table 1. A comparison of the classes can be seen in the Figure 2 based on elapsed time, and on Figure 3 based on covered distance.
